

Reasons for Turning Work Time Management into Workforce Management:

- Focus on employee qualifications
- Longer operating hours
- Creation of incentives for customer-oriented work
- Work and family balance impacts on job satisfaction and workplace productivity
- Bypass downtime
- Improve customer satisfaction
- Flexible reaction to order fluctuations
- Elimination of costly overtime
- Cost transparency
- Improved competitiveness

The Best Solution Always Has a Positive Outcome

A workforce management solution from Interflex means that strategic consultancy and subsequent operational implementation are seamlessly intergrated.

Fundamental components of Interflex consulting services are:

- „As-Is“ analysis of the current situation
- Analysis of operating hours and workflows
- Determination of reserve requirements
- Determination of personnel and qualification requirements
- Development of a framework plan
- Verification of satisfaction of requirements

Competence from the Market Leader

Interflex offers combined, complete solutions for security systems, access control with card production, offline components and biometrics as well as workforce management including time management and personnel scheduling.

Expertise, Performance Efficiency and International Presence

Interflex serves its customers through 35 service and sales offices located throughout Europe. Furthermore, Interflex is supported worldwide through the global network of Ingersoll Rand,

its parent company. Thus, we can be found wherever our customers are located throughout the world. Benefit from over 30 years of project experience. With more

than 14,000 installations managing more than 4.5 million employees, Interflex is the market leader in Europe.

Good Reasons

for Complete Solutions

Security Solutions and Workforce Management

Access Control

Concepts from Easy to Complex - Access Control That Meets Any Demand

Interflex will advise and support you each step of the way towards achieving your personal security solution. Your individual solutions are created from our wide range of software and hardware modules:

- Network-independent offline systems for single doors
- Safeguarding of small and medium-sized companies
- Complex high-security solutions for hospitals, research, development, production, administration and governmental facilities
- Multi-level enterprise solutions with various levels of security

Flexible Security - Intelligent Access System Enhancement

Due to their future-proof features, Interflex solutions have the ability to grow with your requirements and with your business. Furthermore, compatibility among our product generations allows for reliable corporate security and investment protection.

Interflex Security Consulting Group

A complete solution consists of many components. For this reason, the task of the consultancy phase is to identify existing weak points through a hazard and status analysis. This is an extensive security check, which we offer to you as a service.

Biometrics

Increasing Security through Biometric Recognition

Biometric methods significantly increase security in companies and offer users more convenience than previous identification systems. Interflex has incorporated the most widely-used biometric technologies into its systems.

Fingerprint Recognition

A well-priced and yet very secure procedure for identifying a user via the ridges, branches and ends of the papillary lines on a person's fingertips.

Face Recognition

This is a very discreet and safe method in which the user only has to look into a mirror while performing a booking with his/her credential. A camera, which is installed behind the mirror, captures the person's image.

Hand Geometry Recognition

This is a widespread and secure method in which the size and shape of a person's hand and fingers are compared with the person's reference data. The system is ideal for use in dirty and dusty environments.

Iris Recognition

This highly secure procedure compares the pattern of a person's iris with stored reference data. Each person's iris is unique.

Vein Pattern Recognition

With vein pattern recognition, the individual pattern of the veins on the back of a person's hand can easily be recorded, using near-infrared image recognition. This pattern is unique to each person, even in the case of identical twins, as it is determined randomly, not through DNA.

Security Manager

System-Wide Control

Access Control, CCTV cameras, intrusion and fire detection systems or building control systems, can all be monitored from a central location.

Video Surveillance

Complete System Integration

The integration of a video surveillance system allows procedures and events to be monitored in a professional way.

Visitor Management

Organised and Safe

Complete visitor management can be integrated into the system allowing visitor registration and unregistration, printing of visitor passes and report running as well as visitor self-registration at the reception desk.

Parking Lot Control

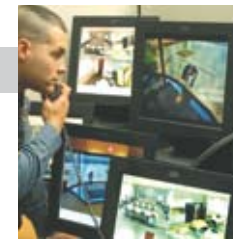

Automated yet Individualised

Automated parking lot management, individual space assignment, visitor reservations and billing – all integrated into the system.

Card Production

Key to Identification

With state-of-the-art systems from Interflex, any company can create, encode and manage their own cards. We provide everything from simple to complex solutions.

Offline Access Control

Security and Convenience with Offline Components

Whether universities, hospitals, caring facilities, banks, insurance companies, community buildings, industrial premises, airports, etc. – offline components are the ideal solution to raise your desired security standard quickly, cost-effectively and with minimal effort. Offline access control increases your security immediately. Precise information regarding which credentials are authorised to open which doors and which access attempts were rejected or permitted, is stored.

The use of offline components creates new possibilities and offers many benefits:

- Low installation and operating costs
- No installation of power or other cables required
- No complicated key management
- Low risk and low cost when credentials are lost
- No programming of the offline components required

NetworkOnCard – the perfect combination of online and offline:

- Online access control
- Offline access control
- Time & attendance recording
- Canteens and vending machines
- Elevator control, etc.
